Attention: Mr. Taffy Davies

Telephone: 905-344-3771

Fax: 905-344-3770

Report Number: 08-03-C0185

3 Pages, 1 Appendix

08-003-6643 Proposal Number:

Date: July 10, 2008

1.0 INTRODUCTION

This report contains the results from the Temperature & Vibration tests performed on three (3) Zafety Lug Lock Units for TAFCAN Consulting Ltd.

The received samples were identified with BTG Sample Number as 08-03-C0185-1 to 3.

2.0 TEST EQUIPMENT

- Data Physics 550 Vibration Controller MII No. A13756, calibrated
- Thermotron Vibration Shaker with Chamber DS640 Asset No. 20041, calibrated
- PCB Accelerometer MII No. B04867, calibrated
- Kistler Power Supply MII No. B04882, calibrated

3.0 PROCEDURES

A representative from TAFCAN was present to install the Zafety Lug Lock onto the lug nuts of the wheel prior to attachment onto the vibration platform.

The vibration tests were performed on the vertical table of the Thermotron DS640 vibration test system. The wheel was attached to the vibration platform with its vertical axis parallel to the vibration platform's thrust direction for vibration testing in the vertical direction (Z) as shown in Appendix A, Figure 1A and 2A.

One accelerometer which provided the control signal was attached to the vibration platform in thrust direction.

We were instructed to perform the vibration test as a sinusoidal vibration dwell at 30 Hz and 3 g acceleration amplitude at ambient temperature of 25 °C (77 °F), 50 °C (122 °F) and -40 °C (-40 °F) for 2 hours at each temperature level. A 15-minute dwell at each temperature level was employed prior to the vibration test.

4.0 RESULTS

The vibration test was performed in sequence listed in Table 1. On completion of the vibration testing at 25 °C, a posttest visual inspection indicated that the Zafety Lug Lock did not sustain any external damages or physical degradation and no evidence of any looseness.

Prior to the vibration test conducted at +50 °C and -40 °C, the representative installed two lug nuts with hand tight onto the top position wheel studs then inserted a Zefety Lug Lock onto them, as shown in Appendix A, Figure 3A.

Again, upon completion of the vibration testing at each temperature level of +55 °C and -40 °C, a posttest visual inspection indicated that the Zafety Lug Lock did not sustain any external damages or physical degradation and no evidence of any looseness of the lug nuts.

Table 1: Test Results

Test Type	Temperature	Comments	Figure #	
	(C)		in Appendix A	
	25	No issue	1A, 2A	
Sine dwell 3g, 30 Hz	+50	No issue	3A, 4A	
	-40	No issue	3A, 5A	

The vibration controller generated plots for the vibration tests are shown in Appendix B, Figures 1B to 3B.
